

Universal Adjustable Equipment Mount

Abstract

An adjustable mount used for mounting equipment of the type used aboard marine or other water-borne craft. The mount itself is mounted to the ship, and has as its main components a hollow, cylindrical C-extrusion, adjustable slide brackets, and mounting brackets. The C-shaped bases of the slide brackets are housed within the hollow center of the C extrusion. Equipment is mounted to the slide brackets, which can be adjusted either up or down on their own axis or laterally across the length of the C extrusion. The mounting brackets secure the entire assembly to the boat structure and serve as an adjustment mechanism for the C-extrusion.
